

Overview

KantanISR™ technology allows members to instantly retrain their KantanMT engines using either the pop-up editor or the KantanAPI™. This means that users can add training data to their engines quickly and easily without having to rebuild an engine. Adding high quality training data to a KantanMT engine will improve the translation quality of that engine and reduce post-editing requirements.

AT A GLANCE:

- Retrains up to 50 source and target segments
- Engine retrains almost instantaneously (5mins)
- No need to rebuild MT engine
- Available on all membership plans

KantanISR - English>French Engine

Why use KantanISR?

KantanISR technology enables you to retrain your KantanMT engine on-demand. When members send a subsequent translation request to a 'retrained' engine, it will use the 'retraining' data they submitted previously as part of the translation process. This means that members can instantly program their KantanMT engines to translate using their preferred style.

Using KantanISR through the KantanAPI

Members can apply the retrain command using HTTP GET requests. The API expects a user authorisation token, client profile name, a source segment and its translation, in the languages the user specified at profile creation time.
